

Policy on Climate Gas Reduction

Coloplast acknowledges the concern on climate changes related to man-made activities.

Coloplast is not particularly energy-intensive, but we still accept responsibility, as the challenge to minimise emissions of climate gases is a collective one.

Our target is to continuously reduce our emissions of climate gases through financially-sustainable initiatives and hereby ensure lower growth in CO₂ emissions than growth in production. When we have the necessary experience – as well as reliable methods of measuring and following up – we will define a target, stating the percentage reduction of CO₂ emissions relative to our growth. Base year will be 2006/07.

The target will be met by reduction of emissions in our value chain that are directly or indirectly controlled by Coloplast.

Gold standard off-sets may be considered as part of our reduction of emissions, but will not be prioritised over financially-sustainable initiatives in own value chain.

The policy will be revised on an annual basis.

Approved by Executive Management, February 2009:

Executive Vice President, Lene Skole
